Make it happen. With PPG

CeramiClear™

For a durable, scratch-resistant factory quality finish

The new generation clearcoat from PPG: CeramiClear

- Durable gloss
- Easy to use
- Effective repair process
- Proven technology

With the introduction of its new patented nano-technology, PPG is at the forefront of advanced clearcoat technology.

As the first supplier of nano-technology to Motor Manufacturers, PPG offers the market a durable scratch-resistant clearcoat, which retains its gloss for much longer.

CeramiClear™ contains nano-particles which accumulate on the surface of the clearcoat, to give it a durable, scratch-resistant glossy finish, proven in numerous rigorous laboratory and road tests.

CeramiClear delivers protection against many environmental influences, such as the damage that can occur in automated car washes.

The knowhow behind this proven nano-particle technology has now been transferred to the refinish arena, allowing you, the repairer, to deliver the same level of scratch-resistance as in the original finish.

Conventional clearcoats are not suitable for the repair of scratch-resistant finishes as they do not have the same level of scratch-resistance and durability.

However, CeramiClear is based on the same scratch-resistant technology applied in the factory and therefore guarantees that the performance of the repair will match the original finish.

Easy to apply, with a simple 2:1 mixing ratio, fast drying and meeting all EU VOC legislation, CeramiClear can be used in the same way as conventional clearcoats.

The difference at a glance

Car wash scratch damage: Conventional 2K Clearcoat

In addition, it comes with its own dedicated fade-out thinner and a polishing system, which allows you to carry out spot repairs.

CeramiClear D8105 gives you the ability to achieve a scratch-resistant repair, equal to the best scratch-resistant finishes from motor manufacturers.

CeramiClear

Make use of this clear advantage!
